Newest 400 series Under Vehicle Inspection Systems manufactured in new sizes with all new material

Sterling, VA. — February 6, 2004 — Vehicle Inspection Technologies, a security products manufacturing firm based in Sterling, VA, today introduced their “Und-aware™” 400-series UVSS product, with new configurations and new materials.

“We knew it needed to be tough because many users lack the time to treat equipment gently,” offers company President, Bill Peterson. “Not even the roughest service will destroy these cast aluminum bases, ramps and tops.”

The engineers at the manufacturing facility pointed out that the newest 400 series product family offers a unique modular design. Models from 2 to 8 camera operation for under vehicle inspection are available. With a variety of imaging and recording options, the units can be configured with up to 16 camera recording capability for additional external imaging of a vehicle's sides, top, front and back; as well as the driver, passenger and license plate. Automatic or manual license plate reading is now an option that can be purchased with the systems.

VIT's 400 series products incorporate the newest technology in cameras and lighting. New white LED's are immune to both heat and cold, and unlike earlier white LED's they can be looked into at night without destroying night vision. New COLOR cameras so necessary for effective inspection are color enhanced and have 10x better light sensitivity.

Vehicle Inspection Technologies is part of a 1972 corporation started by William Peterson, designer of myriad specialty security products for government and industry. The Und-aware™ product family includes above and below-ground, fixed and portable systems ranging from two to 8-cameras to scan the full width of any size vehicle. Constantly upgraded product information is available from their web site at: www.undaware.com.
